# A small hierarchy of languages consisting of non-primitive words 

By PÁL DÖMÖSI (Debrecen), GÉZA HORVÁTH (Debrecen)<br>and MASAMI ITO (Kyoto)

In memory of our late good friend, Professor Dr. Jürgen Duske

#### Abstract

Context-free languages consisting of non-primitive words have been characterized by M. Ito and M. Katsura in 1988. In this paper we show that the same type of characterization can be given for linear, respectively, regular languages consisting of non-primitive words. The observation completes our knowledge on the structure of different languages of non-primitive words.

## 1. Introduction

A word is said to be primitive if it is not a repetition of another word. In other words, a word $p$ is primitive if for any word $w$ and $i \geq 1$, $p=w^{i}$ implies $i=1$. Otherwise we speak about a non-primitive word. Thus, a word is called non-primitive if it is a repetition of another word. The study of relationships between the free semigroup $X^{+}$generated by an alphabet $X$ and the language of all primitive words $Q$ over $X$ has

[^0]received special interest in theoretical computer science. In this paper we investigate properties of languages consisting of non-primitive words in relation with the Chomsky-hierarchy. First we establish that $L \cap Q$, $L \cap Q^{(i)}, i>1, L \cap\left(\cup_{i>1} Q^{(i)}\right)$ are context-sensitive languages whenever $L$ is context-sensitive. Thus a characterization of context-sensitive languages consisting of non-primitive words has no special interest. Context-free languages consisting of non-primitive words are characterized by M. ITO and M. Katsura [1]. In this paper we also characterize regular and linear languages consisting of non-primitive words.

## 2. Preliminaries

Our notions and notation concerning formal languages are standard (see, e.g., [3], [4]). Let $X$ be a finite alphabet with more that one letter and let $X^{*}$ be the free monoid generated by $X$. By $\lambda$ we denote the identity of $X^{*}$. $\lambda$ is often called empty word. We put $X^{+}=X^{*} \backslash\{\lambda\}$. Thus $X^{+}$ denotes the free semigroup generated by $X$. An element $u \in X^{*}$ is called a word over $X$ and $u$ is also called a non-empty word if $u \in X^{+}$. The length of a word $u$ is denoted by $|u|$. Thus $|\lambda|=0$. Any subset $L$ of $X^{*}$ is called a language $L$ over $X$. If there is no danger of confusion then we do not distinguish the element of a singleton set from the singleton set itself. Therefore, for instance, $\{a\}\{b\}^{*}\{c\}$ can be expressed as $a b^{*} c$ and we write $L \backslash \lambda$ for $L \backslash\{\lambda\}$. A word $u$ over $X$ is said to be primitive if $u=v^{n}, v \in X^{*}$ implies $n=1$. Thus the empty word is non-primitive. Throughout this paper, the set of all primitive words over $X$ is denoted by $Q$. In addition, we put $Q^{(i)}=\left\{q^{i} \mid q \in Q\right\}$ for every $i \geq 0$. Then $Q^{(0)}=\lambda$ by definition. Note that any word $u \in X^{+}$can be uniquely expressed as $u=p^{n}, p \in Q$ and $n \geq 1$. (See Lyndon, R. C. and Schützenberger, M. P. [2].) Hence $X^{*}=\cup_{i \geq 0} Q^{(i)}$ is a disjoint union.

In this paper we shall use the following results.
Lemma 1 (Shyr, H. J. and Thierrin, G. [5]). Let $i \geq 1$ and $u v \in\left\{p^{i} \mid p \in Q\right\}$. Then $v u \in\left\{p^{i} \mid p \in Q\right\}$, too. In other words, the sets $\left\{p^{i} \mid p \in Q\right\}(i \geq 1)$ are closed under cyclic permutations of words.

Lemma 2 (Lyndon, R. C. and Schützenberger, M. P. [2]). Let $f, g \in Q, f \neq g$. Then $f^{m} g^{n} \in Q$ for all $m \geq 2, n \geq 2$.

Lemma 3 (see, e.g., Hopcroft, J. E. and Ullman, J. D [3], p. 56, Lemma 3.1.). Let $L$ be a regular language. Then there is a constant $n$ such that if $z$ is any word in $L$ and $|z| \geq n$, then we may write $z=u v w$ in such a way that $|u v| \leq n,|v| \geq 1$, and for all $i \geq 0, u v^{i} w$ is in $L$. Furthermore, $n$ is not greater than the number of states of the smallest finite automaton accepting $L$.

Lemma 4 (see, e.g., Hopcroft, J. E. and Ullman, J. D [3], p. 143, Exercise 6.11.). If $L$ is a linear language then there is a constant $n$ such that if $z$ in $L$ is of length $n$ or greater, then we may write $z=u v w x y$, so that $|u v x y| \leq n,|v x| \geq 1$, and for all $i \geq 0, u v^{i} w x^{i} y$ is in $L$.

## 3. Languages consisting of non-primitive words

It is easy to show that using an appropriate (deterministic) linear bounded automaton it can be decided whether a word is primitive. It is also easy to prove that for every positive integer $i>1$ it can be decided by a (deterministic) linear bounded automaton whether a word is in $Q^{(i)}$. Similarly, by a (deterministic) linear bounded automaton it can be decided whether a word is in $\bigcup_{i>1} Q^{(i)}$. Thus these languages are contextsensitive. On the other side, it is well-known that the class of contextsensitive languages is closed under intersection. Thus for every contextsensitive language $L$, the languages $L \cap Q, L \cap Q^{(i)}, i>1, L \cap\left(\bigcup_{i>1} Q^{(i)}\right)$ are also context-sensitive. By this simple observation we obtain that all context-sensitive languages consisting of non-primitive words have the form $L=L^{\prime} \cap\left(\bigcup_{i>1} Q^{(i)}\right)$, where $L^{\prime}$ is context-sensitive. Conversely, for every context-sensitive language $L^{\prime}$, the language $L=L^{\prime} \cap\left(\bigcup_{i>1} Q^{(i)}\right)$ is also context-sensitive. Thus one can obtain a rather simple characterization of context-sensitive (or more complex) languages consisting of non-primitive words.

For the context-free case the following characterization is proved.
Theorem 1 (Ito, M. and Katsura, M. [1]). Let $L$ be a context-free language such that $L \subseteq X^{+} \backslash Q$. Then $L_{1}=L \cap Q^{(2)}$ is a context-free
language and $L_{2}=L \cap\left(\bigcup_{i \geq 3} Q^{(i)}\right)$ is a regular language. More exactly,

$$
L_{1}=F_{1} \cup\left(\bigcup_{1 \leq i \leq r}\left\{\left(a_{i}^{n} b_{i} a_{i}^{m}\right)^{2} \mid n, m \geq 1\right\}\right) \cup\left(\bigcup_{1 \leq j \leq s}\left\{\left(f_{j} g_{j}^{n} h_{j}\right)^{2} \mid n \geq 1\right\}\right)
$$

where $F_{1}$ is a finite subset of $Q^{(2)}$ and $a_{i}^{2} b_{i} \in Q, 1 \leq i \leq r, f_{j} g_{j} h_{j} \in Q$, $1 \leq j \leq s$,

$$
L_{2}=F_{2} \cup\left(\bigcup_{1 \leq i \leq r} f_{i}^{m_{i}}\left(f_{i}^{k_{i}}\right)^{*}\right)
$$

where $F_{2}$ is a finite subset of $\bigcup_{i \geq 3} Q^{(i)}$ and $f_{i} \in Q, m_{i} \geq 3, k_{i} \geq 1$, $1 \leq i \leq r$.

We now show the following
Theorem 2. Let $L$ be a linear language such that $L \subseteq X^{+} \backslash Q$. Then $L_{1}=L \cap Q^{(2)}$ is a linear language and $L_{2}=L \cap\left(\bigcup_{i \geq 3} \overline{Q^{(i)}}\right)$ is a regular language. More exactly,

$$
L_{1}=F_{1} \cup\left(\bigcup_{1 \leq j \leq s}\left\{\left(f_{j} g_{j}^{n} h_{j}\right)^{2} \mid n \geq 1\right\}\right)
$$

where $F_{1}$ is a finite subset of $Q^{(2)}, f_{j} g_{j} h_{j} \in Q, 1 \leq j \leq s$, and $L_{2}$ has the same structure as in Theorem 1.

Proof. It is well-known that for every linear language $L$, the language $L \cap R$ is also linear whenever $R$ is regular. On the other hand, by Theorem 1 $L_{2}=L \cap\left(\bigcup_{i \geq 3} Q^{(i)}\right)$ is regular for every context-free language $L$. Thus $L_{2}$ is also regular if $L$ is linear. Therefore, $L_{1}=L \cap Q^{(2)}$ is linear if $L$ is linear. It remains to prove that $L_{1}=F_{1} \cup\left(\bigcup_{1 \leq j \leq s}\left\{\left(f_{j} g_{j}^{n} h_{j}\right)^{2} \mid n \geq 1\right\}\right)$ where $F_{1}$ is a finite set and $f_{j} g_{j} h_{j} \in Q, 1 \leq j \leq s$. Observe that a language $\left\{\left(f g^{n} h\right)^{2} \mid n \geq 1\right\}$ can be generated by the linear rules $S \rightarrow f T h$, $T \rightarrow g T g, T \rightarrow h f$. Thus $L_{1}$ can be generated by a linear grammar. For any $a, b \in X^{+},\left\{a^{j} b a^{j+k} b a^{k} \mid j<n, k \geq n\right\},\left\{a^{j} b a^{j+k} b a^{k} \mid j \geq n, k<n\right\}$ have the form $\left\{\left(f g^{n} h\right)^{2} \mid n \geq 1\right\}$ by $f=a^{j} b, g=a, h=\lambda$ and $f=\lambda$, $g=a, h=b a^{k}$, in order. Moreover, $\left\{a^{j} b a^{j+k} b a^{k} \mid j, k<n\right\}$ is finite. The
complement of the union of these languages is $\left\{a^{j} b a^{j+k} b a^{k} \mid j, k \geq n\right\}$. By Theorem 1, it is now enough to show that for every linear language $L$ there exists an $n \geq 1$ such that $L$ does not contain elements of $\left\{a^{j} b a^{j+k} b a^{k} \mid\right.$ $j, k \geq n\}$.

Assume the contrary, and let $L$ be a linear language with a positive integer $n$ as in Lemma 4. Using again that the intersection of a linear and a regular language is also linear, we may consider $L \cap a^{+} b a^{+} b a^{+}$as a linear language. Then $L \cap\left\{a^{j} b a^{j+k} b a^{k} \mid j, k \geq 1\right\} \subseteq Q^{(2)}$ is also linear.

Consider an element $z=a^{s} b a^{s+t} b a^{t}$ of the language $L \cap\left\{a^{j} b a^{j+k} b a^{k} \mid\right.$ $j, k \geq 1\}$ such that $s, t \geq n$. Then, by Lemma 4 , there exists a decomposition $z=u v w x y,|u v x y| \leq n,|v x| \geq 1$ such that for all $i \geq 0, u v^{i} w x^{i} y$ is in $L$. On the other hand, linear languages are closed under homomorphism and inverse homomorphism. Thus we can suppose that $u, v, x, y \in a^{*}$. Indeed, we can take a homomorphism $\psi:\{c, d\} \rightarrow X^{*}$ with $\psi(c)=a$, $\psi(d)=b$ and a decomposition $u^{\prime} v^{\prime} w^{\prime} x^{\prime} y^{\prime}$ of the word $z^{\prime}=c^{s} d c^{s+t} d c^{t}$ with $\left|u^{\prime} v^{\prime} x^{\prime} y^{\prime}\right| \leq n^{\prime},\left|v^{\prime} x^{\prime}\right| \geq 1, u^{\prime} v^{\prime i} w^{\prime} x^{\prime i} y^{\prime} \in\left\{c^{j} d c^{j+k} d c^{k} \mid j, k \geq 1\right\}$, $i \geq 0$, where $n^{\prime}$ is an appropriate positive integer. Obviously, we now have $\psi\left(u^{\prime}\right)=u, \psi\left(v^{\prime}\right)=v, \psi\left(w^{\prime}\right)=w, \psi\left(x^{\prime}\right)=x, \psi\left(y^{\prime}\right)=y$ leading to $u, v, x, y \in a^{*}$ if $s$ and $t$ are big enough.

At the same time, $z=a^{s} b a^{s+t} b a^{t} \in Q^{(2)}$ is supposed. Therefore, $a^{s} b \in Q$. Put $f=a^{s} b$ and $g=h$ with $h \in Q, h^{k}=a$. By Lemma 2, $f^{m} g^{n} \in Q, m, n \geq 2$.

Thus we obtain $w x^{i} y u v^{i} \in Q, i>1$. But, by Lemma $1, u v^{i} w x^{i} y \in Q$, $i>1$ contradicting $u v^{i} w x^{i} y \in Q^{(2)}, i \geq 0$.

Next we prove
Theorem 3. Let $L$ be a regular language such that $L \subseteq X^{+} \backslash Q$. Then $L_{1}=L \cap Q^{(2)}$ is a finite language and $L_{2}=L \cap\left(\bigcup_{i \geq 3} Q^{(i)}\right)$ has the same structure as in Theorem 1.

Proof. By Theorem 2 it is enough to prove that for any $a, b, c \in X^{+}$, $L \cap Q^{(2)}$ does not contain infinitely-many elements of $\left\{\left(a b^{m} c\right)^{2} \mid m \geq 1\right\}$. Suppose the contrary. Then, by Lemma 3, there exists a positive integer $n$ such that $m>n$ implies a decomposition $z=u v w$ of $\left(a b^{m} c\right)^{2}$ such that $|u v| \leq n,|v| \geq 1$ and $u v^{i} w \in L, i \geq 0$. Regular languages are also closed under homomorphism and inverse homomorphism. Hence, similarly to the
proof of the previous theorem, we may assume:

1. $v=a$ or
2. $v \in b^{+}$or
3. $v \in a b^{+}$.
4. First suppose $v=a$. Then $a^{i} b^{m} c a b^{m} c \in L, i \geq 0$ by Lemma 3 . Using Lemma 2, by $f=a b^{m} c$ and $g=d, d \in Q, d^{k}=a$ it holds that $a b^{m} c a b^{m} c a^{i} \in Q, i \geq 2$. Applying Lemma 1 we obtain $a^{i} b^{m} c a b^{m} c \in Q$, $i \geq 3$ contradicting $a^{i} b^{m} c a b^{m} c \in Q^{(2)}, i \geq 0$.
5. Suppose $v \in b^{+}$. Then there exists $k>0$ such that $a b^{m+i * k} c a b^{m} c \in L$, $i \geq 0$ by Lemma 3. Using Lemma 2 , by $f=c a b^{m}$ and $g=d, d \in Q, d^{j}=b$ it holds that $c a b^{m} c a b^{m+i} \in Q, i \geq 2$. Applying Lemma 1 we obtain $a b^{m+i} c a b^{m} c \in Q, i \geq 2$ contradicting $a b^{m+i * k} c a b^{m} c \in Q^{(2)}, i \geq 0$.
6. Finally suppose $v \in a b^{+}$. Then there exists $k>0$ such that $\left(a b^{k}\right)^{i} b^{m-k} c a b^{m} c \in L, i \geq 0$ by Lemma 3. Using Lemma 2, by $f=b^{m-k} c a b^{k}$ and $g=d, d \in Q, d^{j}=a b^{k}$ it holds that $b^{m-k} c a b^{m} c a b^{k}\left(a b^{k}\right)^{i} \in Q, i \geq 2$. Applying Lemma 1 we obtain $\left(a b^{k}\right)^{i+1} b^{m-k} c a b^{m} c \in Q, i \geq 2$ contradicting $\left(a b^{k}\right)^{i} b^{m-k} c a b^{m} c \in Q^{(2)}, i \geq 0$.

## 4. Summary

We can summarize our results in the following.
Corollary 1. Let $\mathcal{L}_{0}, \mathcal{L}_{1}, \mathcal{L}_{2}, \mathcal{L}_{3}$ be classes of languages such that $\mathcal{L}_{0}$ is the class of all finite languages in $X^{+} \backslash Q, \mathcal{L}_{1}$ is the class of languages having the form $\bigcup_{1 \leq i \leq r} f_{i}^{m_{i}}\left(f_{i}^{k_{i}}\right)^{*}, f_{i} \in Q, m_{i} \geq 3, k_{i} \geq 1,1 \leq i \leq r, \mathcal{L}_{2}$ is the class of languages of the form $\bigcup_{1 \leq j \leq s}\left\{\left(f_{j} g_{j}^{n} h_{j}\right)^{2} \mid n \geq 1\right\}, f_{j} g_{j} h_{j} \in Q, 1 \leq j \leq s$, and $\mathcal{L}_{3}$ is the class of languages with the structure $\bigcup_{1 \leq i \leq r}\left\{\left(a_{i}^{n} b_{i} a_{i}^{m}\right)^{2} \mid\right.$ $n, m \geq 1\}$ where $a_{i}^{2} b_{i} \in Q, 1 \leq i \leq r$. Then the following statements hold:
(a) $L$ is a context-free language consisting of non-primitive words if and only if $L=L_{0} \cup L_{1} \cup L_{2} \cup L_{3}, L_{i} \in \mathcal{L}_{i}, i=0,1,2,3$.
(b) $L$ is a linear language consisting of non-primitive words if and only if $L=L_{0} \cup L_{1} \cup L_{2}, L_{i} \in \mathcal{L}_{i}, i=0,1,2$.
(c) $L$ is a regular language consisting of non-primitive words if and only if $L=L_{0} \cup L_{1}, L_{i} \in \mathcal{L}_{i}, i=0,1$.
(d) $L$ is a finite language consisting of non-primitive words if and only if $L=L_{0}, L_{0} \in \mathcal{L}_{0}$.

Of course, the statement (a) is the same as Theorem 1 [1] and the statement (d) is trivial.
