Title: On the volume of the convex hull of $d+1$ segments in $\mathbb{R}^d$

Author(s): Gennadiy Averkov and Horst Martini

Let $d \geq 2$, $m \geq d$, and $u_1, \ldots, u_m$ be non-zero vectors linearly spanning $\mathbb{R}^d$. The note is devoted to the problem of minimizing the volume of the polytopes $P := \text{conv}(I_1 \cup \cdots \cup I_m)$, where, for $j = 1, \ldots, m$, $I_j$ is a translate of $\text{conv}\{o, u_j\}$. The solution of this problem for the case $m = d$ was previously known. For the case $m = d + 1$ the minimal volume is evaluated and the class of minimizing polytopes $P$ is studied.
