Title: On reducible trinomials, IV

Author(s): Andrzej Schinzel

Let \( n > m \) be positive integers, \( d = (n,m) \), \( n = dn_1 \), \( m = dm_1 \) and \( T(x) = x^n + Ax^m + B \) defined over a field \( K \) be such that \( x_1^n + Ax_1^m + B \) has a linear or quadratic factor \( f \) in \( K[x] \). The paper deals with reducibility over \( K \) of \( T(x)/f(x^d) \) and supplements earlier papers of this series.
