

Generalized binomials in fractional calculus

By MIRKO D’OVIDIO (Roma), ANNA CHIARA LAI (Roma) and PAOLA LORETI (Roma)

Abstract. We consider a class of generalized binomials emerging in fractional calculus. After establishing some general properties, we focus on a particular yet relevant case, for which we provide several ready-for-use combinatorial identities, including an adapted version of the Pascal’s rule. We then investigate the associated generating functions, for which we establish a recursive, combinatorial and integral formulation. From this, we derive an asymptotic version of the Binomial Theorem. A combinatorial and asymptotic analysis of some finite sums completes the paper.
