

## On the majorants of general Fourier coefficients and best approximations

By VAKHTANG TSAGAREISHVILI (Tbilisi)

**Abstract.** Throughout this paper, we define the majorants for general Fourier coefficients of functions of bounded variation and also the majorants for the best approximations by means of the space  $L_2$  of functions of bounded variation. It is proved that in different cases the majorants are different sequences. In this paper, we also study the majorants with respect to the classical orthonormal systems (trigonometric, Haar and Walsh systems). In addition, the behavior of subsequences of general orthonormal systems is given.
