Title: Linearizable 3-webs and the Gronwall conjecture

Author(s): Joseph Grifone, Zoltán Muzsnay and J. Saab

In the article [**?**], we studied the linearizability problem for 3-webs on 2-dimensional manifolds. Presenting in [**?**] the elements of the theory and the results, we announced a forthcoming paper with all the computations and explicit formulas. Four years after the publication of our article V. V. GOLDBERG and V. V. LYCHAGIN obtained similar results by a different method in [**?**] and [**?**]. However, they obtained incorrect results on the linearizability of a certain web, as it was shown in [**?**]. Now, as it was announced in [**?**], we present the complete version of [**?**] with computations and explicit formulas, because this theory shows effectiveness and correctness in concrete examples.
