Title: On locally graded n -Engel and positively n -Engel groups

Author(s): Beata Bajorska and Olga Macedońska

We discuss four problems concerning n -Engel and so called *positively* n -Engel groups. As the answer to one of them we prove that in the class of locally graded groups every *positively* n -Engel group is locally nilpotent, which extends a similar result of D. M. Riley for residually finite groups.
