Title: On reducible trinomials, IV

Author(s): Andrzej Schinzel

Let $n > m$ be positive integers, $d = (n, m)$, $n = dn_1$, $m = dm_1$ and $T(x) = x^n + Ax^m + B$ defined over a field K be such that $x_1^n + Ax_1^m + B$ has a linear or quadratic factor f in $K[x]$. The paper deals with reducibility over K of $T(x)/f(x^d)$ and supplements earlier papers of this series.
