Title: A note on the corank of abelian groups

Author(s): Marco Perone and Edmund R. Puczyłowski

The corank of abelian groups is a concept dual to the well established notion of the rank of such groups. Both of them can be considered as group analogs of the linear dimension. In [?] abelian groups whose rank satisfies counterparts of some fundamental properties of the linear dimension were described. In this paper we study similar questions related to the corank of abelian groups.
