Title: Generalized derivations which extend the concept of Jordan homomorphism

Author(s): Vincenzo De Filippis and Giovanni Scudo

Let R be a prime ring, U the right Utumi quotient ring of R , C its extended centroid, I a non-zero right ideal of R , $f(x_1, \dots, x_n)$ a non-central multilinear polynomial over C , F, G two generalized derivations of R , $m \geq 1$ a fixed integer. Denote $f(I)$ the set of all evaluations of the polynomial $f(x_1, \dots, x_n)$ in I . If $F(u^m) = G(u)^m$, for any $u \in f(I)$, then we describe all possible forms of F and G .
