Title: On the factors of Stern polynomials II.
Proof of a conjecture of M. Gawron

Author(s): Andrzej Schinzel

Let $B_n(x)$ be the n -th Stern polynomial in the sense of KLAVŽAR *et al.* [2]. GAWRON's conjecture [1] about the natural density of indices n such that $B_n(t) = 0$, where $t = -1/2, -1/3$, is proved and generalized. Similar questions are treated.
