

Title: Characterization of the Euler gamma function with the aid of an arbitrary mean

Author(s): Janusz Matkowski

We prove that a continuous function $f : (0, \infty) \rightarrow (0, \infty)$ satisfying the functional equation

$$f(x+1) = xf(x), \quad x > 0, \quad f(1) = 1,$$

is the Euler gamma function iff for some $a > 0$ and a strict and continuous mean $M : (a, \infty)^2 \rightarrow (a, \infty)$, the following inequality holds:

$$f(M(x, y)) f\left(\frac{xy}{M(x, y)}\right) \leq f(x) f(y), \quad x, y \in (a, \infty).$$

Taking for M the geometric mean $G(x, y) = \sqrt{xy}$, we obtain the result of [2] generalizing the classical BOHR–MOLLERUP theorem [1]. For $M = A$, where $A(x, y) = \frac{x+y}{2}$ is the arithmetic mean, the assumed inequality reduces to $f(A(x, y)) f(H(x, y)) \leq f(x) f(y)$ for all $x, y > a$, where H is the harmonic mean, and the result gives a new characterization of the gamma function, involving the arithmetic and harmonic means.
