Title: On the number of monogenizations of a quartic order
(with an appendix by Shabnam Akhtari)

Author(s): Manjul Bhargava

We show that an order in a quartic field has fewer than 3000 essentially different generators as a \mathbb{Z} -algebra (and fewer than 200 if the discriminant of the order is sufficiently large). This significantly improves the previously best known bound of 2^{72} .

Analogously, we show that an order in a quartic field is isomorphic to the invariant order of at most 10 classes of integral binary quartic forms (and at most 7 if the discriminant is sufficiently large). This significantly improves the previously best known bound of 2^{80} .
