Comparing zeros of distinct Dirichlet L-functions

By WILLIAM D. BANKS (Columbia)

Abstract. For any $\theta > \frac{1}{3}$, we show that there are constants $c_1, c_2 > 0$ depending only on θ for which the following property holds. If χ_1 , χ_2 are two distinct primitive Dirichlet characters mod q, and $T \geq c_1 q^{\theta}$, then $L(s, \chi_1)$ and $L(s, \chi_2)$ do not have the same zeros in the region

$$\mathcal{R} := \left\{ s = \sigma + it \in \mathbb{C} : 0 < \sigma < 1, \ T < t < T + c_2 q^{\theta} \log T \right\}.$$

For cubefree moduli q, the same result holds for any $\theta > \frac{1}{4}$.
