Title: Finsleroid–Finsler space of involutive case and A -special relation

Author(s): G. S. Asanov

The involutive case means the framework in which the characteristic scalar $g(x)$ may vary in the direction assigned by the input 1-form b , such that $dg = \mu b$ with a scalar $\mu(x)$. Required calculation shows that in the Finsleroid–Finsler space the involutive case realizes through the A -special relation the picture that instead of the Landsberg condition $\dot{A}_{ijk} = 0$ we have the vanishing $\dot{\alpha}_{ijk} = 0$ with the normalized tensor $\alpha_{ijk} = A_{ijk}/\|A\|$. Success is predetermined by a reached possibility to write down the associated spray coefficients in the transparent form that accounts for the dependence $g = g(x)$. Interesting particular properties of the associated $h\nu$ -curvature tensor come to play.
