Title: On the Diophantine equation $X^2 - (2^{2m} + 1)Y^4 = -2^{2m}$

Author(s): Bo He, Alain Togbé and P. Gary Walsh

Using a recent result of Akhtari on quartic Thue equations, it is shown that the quartic equation $X^2 - (2^{2m} + 1)Y^4 = -2^{2m}$ has at most 12 solutions in odd positive integers $X, Y > 1$.
