Title: A homomorphic encryption-based secure electronic voting scheme

Author(s): Andrea Huszti

In this paper we propose a homomorphic encryption-based secure electronic voting scheme that is based on [**?**]. It guarantees eligibility, unreusability, privacy, verifiability and also receipt-freeness and uncoercibility. The scheme can be implemented in a practical environment, since it does not use voting booth or untappable channel, only anonymous channels are applied.
