Title: Fractional part integral representation for derivatives
of a function related to $\ln \Gamma(x+1)$

Author(s): Mark W. Coffey

For $0 \neq x > -1$ let

$$\Delta(x) = \frac{\ln \Gamma(x+1)}{x}.$$

Recently Adell and Alzer proved the complete monotonicity of Δ' on $(-1, \infty)$ by giving an integral representation of $(-1)^n \Delta^{(n+1)}(x)$ in terms of the Hurwitz zeta function $\zeta(s, a)$. We reprove this integral representation in different ways, and then re-express it in terms of fractional part integrals. Special cases then have explicit evaluations. Other relations for $\Delta^{(n+1)}(x)$ are presented, including its leading asymptotic form as $x \rightarrow \infty$.
