**Title:** On the factors of Stern polynomials II.  
Proof of a conjecture of M. Gawron

**Author(s):** Andrzej Schinzel

Let  $B_n(x)$  be the  $n$ -th Stern polynomial in the sense of KLAVŽAR *et al.* [2]. GAWRON's conjecture [1] about the natural density of indices  $n$  such that  $B_n(t) = 0$ , where  $t = -1/2, -1/3$ , is proved and generalized. Similar questions are treated.
