**Title:** Commutativity of Cho and normal Jacobi operators on real hypersurfaces in the complex quadric

**Author(s):** Juan de Dios Pérez and Young Jin Suh

On a real hypersurface in the complex quadric we can consider the Levi-Civita connection and, for any non-zero real constant  $k$ , the  $k$ -th generalized Tanaka–Webster connection. We prove the non-existence of real hypersurfaces in the complex quadric for which the covariant derivatives associated to both connections coincide when they act on the normal Jacobi operator of the real hypersurface.
