

Heisenberg double of some quantum group and its representations

By WEI WANG (Zhenjiang), LIMENG XIA (Zhenjiang) and SENRONG XU (Zhenjiang)

Abstract. Let $\mathfrak{g}, \mathfrak{h}$ be two indecomposable solvable Lie algebras with dimension 5 and special given structure constants. Their quantized universal enveloping algebras are Hopf algebras, and they are the Hopf duals of each other. The Heisenberg double \mathcal{D}_q is the smash product of these two Hopf algebras. In this paper, we study the weight modules, the prime spectrum and the automorphism group of the Heisenberg double \mathcal{D}_q .
